PREFACE

THE present work is the outcome of a decision, arrived at some two years ago, to catalogue and label all the Type specimens of Rhopalocera in the British Museum (Natural History). Until recently many undoubted Type specimens stood in the Collections without any indication of their especial value; and as a consequence, in the past, not a few were discarded and replaced by 'better' specimens. It was largely through a desire to ensure against any possibility of a recurrence of such treatment in the future that the work was undertaken.

For the purpose of cataloguing, the groups Morphinae and Brassolinae, variously treated as subfamilies of Satyridae or of Nymphalidae, or as independent families, have been included, as this arrangement seems the most natural, and the whole is arranged in the alphabetical order of the specific (and minor) names. The generic names under which the species were originally described are added, and also the original references, dates of publication, and sexes of specimens. Every effort has been made to obtain the greatest degree of accuracy, both as to the specimens listed and as to the references quoted, but the authors realize that there must be contained in the list errors which they have overlooked, both of omission and of commission, and they would be glad to have their attention called to these.

Some 3,900 Type specimens belonging to the Satyridae are here listed—a total so large that publication of the list in book form appeared to be necessary before continuing with the work, as it was felt that the information collected in the process of cataloguing might possibly be of some considerable assistance to other workers in this field.

The work was commenced by Mr. N. D. Riley, but actually the greater part of it has been done, under his supervision, by Mr. A. G. Gabriel.
